

Project Description

I compose portrait photographs that I make with a digital camera. I make a print of each image on paper that I stain with paint and botanicals. I place the print in a small container and freeze it in water with plants and other substances. While the items congeal, I apply gel food color with a syringe, and when everything is icy, I photograph it. The resulting image is a fusion of my original portrait photograph, the material I arrange with the print, and the unique impression created by the natural process of water freezing.
